

OpenBSD

The real security focused Operating System

riccardo.veraldi@cnaf.infn.it

What is OpenBSD

- It IS NOT Linux
- It is a FREE, multi-platform 4.4BSD-based UNIX-like **complete operating system**
- Founded in 1995 by Theo de Raadt
- Forked from NetBSD 1.0

OpenBSD project goals

- Provide the best development platform possible. Provide full source access to developers and users, including the ability to look at CVS tree changes directly.
- Greater integration of cryptographic software
- Provide code that can be freely used, copied, modified, and distributed by anyone and for any purpose.
- Be NUMBER ONE in the industry for security
- Track and implement standards (ANSI, POSIX, parts of X/Open, etc.)
- Work towards a very machine independent source tree
 - Support for different hw platforms

OpenBSD supported platforms

<u>alpha</u>	Digital Alpha-based systems
<u>amd64</u>	AMD64-based systems
<u>arm64</u>	64-bit ARM systems
<u>armv7</u>	ARM based devices, such as BeagleBone, PandaBoard, CuBox-i, SABRE Lite, Nitrogen6x and Wandboard
<u>hppa</u>	Hewlett-Packard Precision Architecture (PA-RISC) systems
<u>i386</u>	Standard PC and clones based on the Intel i386 architecture and compatible processors
<u>landisk</u>	IO-DATA Landisk systems (such as USL-5P) based on the SH4 cpu
<u>loongson</u>	Loongson 2E- and 2F-based systems, such as the Lemote Fuloong and Yeeloong, Gdium Liberty, etc.
<u>luna88k</u>	Omron LUNA-88K and LUNA-88K2 workstations
<u>macppc</u>	Apple <i>New World</i> PowerPC-based machines, from the iMac onwards
<u>octeon</u>	Cavium Octeon-based MIPS64 systems
<u>powerpc64</u>	IBM POWER-based PowerNV systems
<u>sparc64</u>	Sun UltraSPARC and Fujitsu SPARC64 systems

Proactive Security

- It is a cultural approach: «when we make a security technology, we apply it to the maximum extent possible, and don't wait for chance adoption and integration by others»
- OpenBSD audit process
 - Team of 6 to 12 members who constantly look for and fix security holes
 - Comprehensive file-by-file analysis of every critical software component
 - Looking for basic software bugs which years later is discovered to be a security issue
 - Code gets audited multiple times, and by multiple people with different auditing skills.
- Linux has hardening features but they are *optional*
 - First thing all people does after installing a Linux distribution is **disable selinux**
 - Linux is a kernel, all the rest comes from the specific Distribution flavor (with all possible security flaws)

OpenBSD Innovations

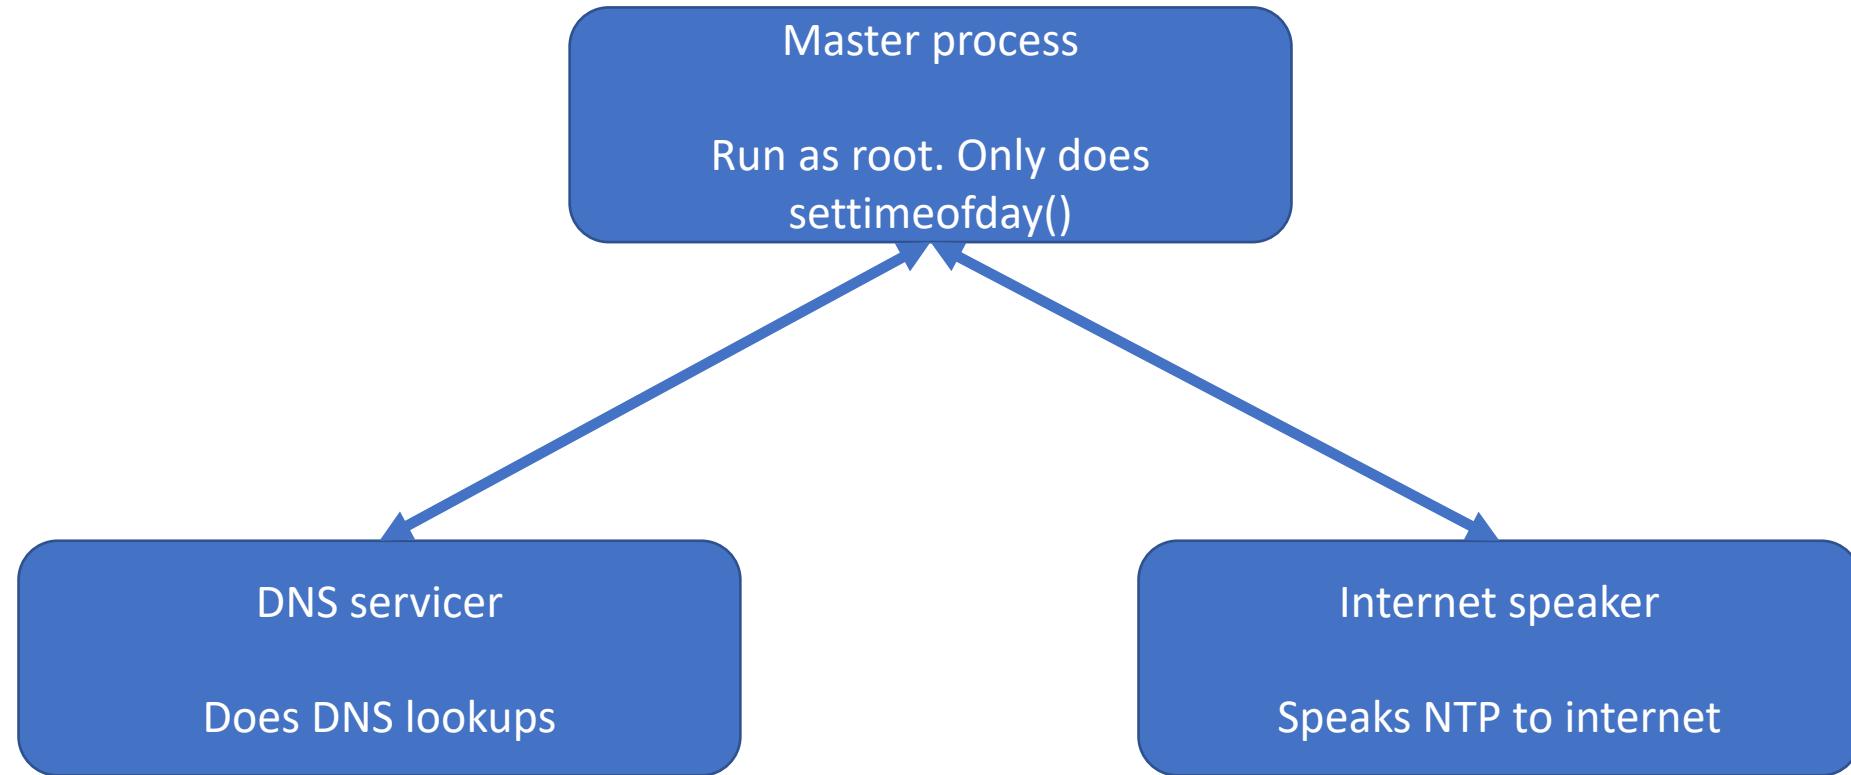

- First free operating system to implement a IPSec VPN stack (1997)
- Privilege separation: first released with OpenSSH (2002)
- Privilege revocation: ping, traceroute
- Stack protector: propolice (2002) implemented system wide
- W^X (2003)
- GOT and PLT protection: ro outside of ld.so
- ALSR (2003)
- PIE (2013)
- SROP (2016): sigreturn()
- Static-PIE
- Library order randomization
- Trapsleds (2017)
- Kernel relinking at boot (2017)
- RETGUARD
- ...

- Pioneered by the OpenBSD project in 3.3 in 2002, strictly enforced in 6.0
- Memory can either be write or execute, but not both (XOR)
- Similar to PaX Linux kernel extension (developed later)

Privilege Separation

- Split a program into processes performing different sub-functions
- Each process is designed to operate in a separate security domain
- Now used in almost all privileged programs in OpenBSD: [bgpd\(8\)](#),
[dhclient\(8\)](#), [dhcpd\(8\)](#), [dvmrpd\(8\)](#), [eigrpd\(8\)](#), [file\(1\)](#), [httpd\(8\)](#), [iked\(8\)](#),
[ldapd\(8\)](#), [ldpd\(8\)](#), [mountd\(8\)](#), [npppd\(8\)](#), [ntpd\(8\)](#), [ospfd\(8\)](#), [ospf6d\(8\)](#),
[pflogd\(8\)](#), [radiusd\(8\)](#), [relayd\(8\)](#), [ripd\(8\)](#), [script\(1\)](#), [smtpd\(8\)](#), [syslogd\(8\)](#),
[tcpdump\(8\)](#), [tmux\(1\)](#), [xconsole\(1\)](#), [xdm\(1\)](#), [Xserver\(1\)](#), [ypldap\(8\)](#),
[pkg_add\(1\)](#), etc.

Privilege Separation example: OpenNTPD

Privilege Separation: pledge()

- Pledge syscall requests that only (a carefully selected) subset of POSIX functionality be permitted
- Subsets such as: stdio rpath wpath cpath fattr inet dns getpw proc exec sendfd recvfd ...
- Deep functional support in the kernel — more sophisticated than *seccomp*
 - pledge was designed so more applications can use it, by exposing all argument details
- I pledge this is the only subset of POSIX I will use, otherwise program will be killed

```
imsg_init(ibuf_dns, pipe_ntp[1]);
if (pledge("stdio dns", NULL) == -1)
    err(1, "pledge")
```

- Implementation errors found in 10% of privsep programs

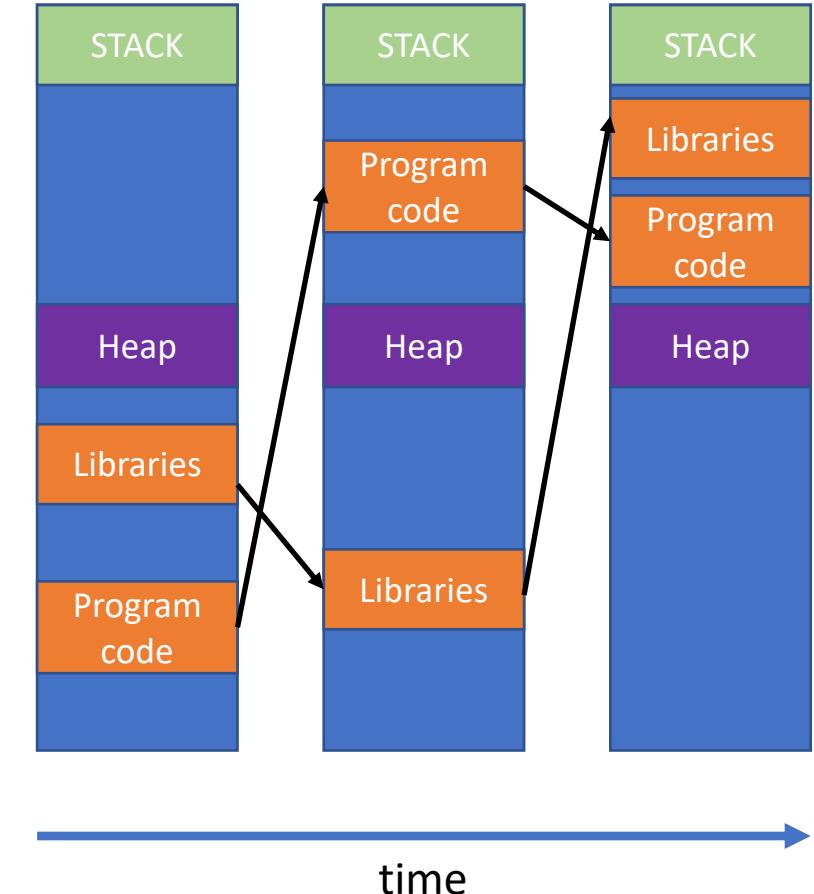

Privilege Separation: unveil()

- Implemented in OpenBSD 6.4
- Hide the filesystem and only expose parts you need
- `unveil("/home/veraldi", "r")`
- Accessing anything other than `/home/veraldi` will throw `ENOENT`
- Trying to write to `/home/veraldi` will throw `EINVAL` or `EP`

Address Space Layout Randomisation (ASLR)

- Libraries, heap, program code are randomly distributed through virtual memory each time the program starts
- Random stack offset
- Every execution of a binary ends up in a different layout
- This makes it hard for an attacker to predict memory addresses and process behaviour

KARL

- Relinks kernel libraries in random orders
- Individually randomizes the object files that get linked into the binary
 - Unlike Linux's kernel address space layout randomization (KASLR), which randomizes the base address for all of the kernel code
- A single information leak of a function address from the kernel does not leak information about the location of all other functions.

arc4random()

- “A Replacement Call for Random”
 - `rand()` function conforms to ANSI X3.159-1989 (“ANSI C89”).
 - `rand_r()` function conforms to IEEE Std 1003.1-2008 (“POSIX.1”).
 - The `srand()` function does not conform to ANSI X3.159-1989 (“ANSI C89”)
- Very high quality random numbers
- Originally used RC4
- Now uses ChaCha20
- It may be replaced again in the future as cryptographic techniques advance

And more...

- Position-Independent Executables (PIE)
 - First OS to enable PIE by default
- RETGUARD
 - Mitigation against ROP exploits
 - Compiler-based exploit mitigation
 - Combine the function return address with a random cookie
 - Details at <https://doi.asiabsdcon.org/10.25263/asiabsdcon2019/p01b>
- Randomized PIDs
 - OpenBSD spawns each new process with a random, unused PID. This protects the user from attacks that predict new PIDs

New functions

- `strlcpy()`, `strlcat()`: They are designed to be safer, more consistent, and less error prone replacements
- `reallocarray()`: Designed for safe allocation of arrays
- `pledge()`
- `unveil()`
- `timingsafe_memcmp()`
- ...

OpenBSD projects and more

- OpenSSH: we all know what is it
- LibreSSL: forked from OpenSSL dueing Heartbleed vuln+libtls
- OpenRSYNC: reimplementaion of rsync with priv separation
- pf: packet filter, ported to many other OSes
- vmm/vmd: hypervisor
- switchd: virtual switch (openflow specs)
- Unwind: DNS resolver
- Xenocara: X11 implementation (privilege separation)
- Doas: replacement for sudo
- httpd: replacement. For apache and nginx
- OpenSMTPD: new SMTP MTA
- CARP: secure, free alternative to the VRRP and the HSRP

Welcome to the OpenBSD/amd64 6.7 installation program.
(I)nstall, (U)pgrade, (A)utoinstall or (S)hell? I
At any prompt except password prompts you can escape to a shell by
typing '!'. Default answers are shown in []'s and are selected by
pressing RETURN. You can exit this program at any time by pressing
Control-C, but this can leave your system in an inconsistent state.

Choose your keyboard layout ('?' or 'L' for list) [default]
System hostname? (short form, e.g. 'foo') puffy

Available network interfaces are: vio0 wlan0.
Which network interface do you wish to configure? (or 'done') [vio0]
IPv4 address for vio0? (or 'dhcp' or 'none') [dhcp] 172.16.11.84
Netmask for vio0? [255.255.255.0] 255.255.254.0
IPv6 address for vio0? (or 'autoconf' or 'none') [none]
Available network interfaces are: vio0 wlan0.
Which network interface do you wish to configure? (or 'done') [done]
Default IPv4 route? (IPv4 address or none) 172.16.10.1
add net default: gateway 172.16.10.1
DNS domain name? (e.g. 'example.com') [mu.domain1] cnaf.infn.it
```

OpenBSD Installation (6)

```
Default IPv4 route? (IPv4 address or none) 172.16.10.1
add net default: gateway 172.16.10.1
DNS domain name? (e.g. 'example.com') [my.domain] cnaf.infn.it
DNS nameservers? (IP address list or 'none') [none] 131.154.3.1
```

```
Available disks are: sd0 sd1.
Which disk is the root disk? ('?' for details) [sd0] sd1
No valid MBR or GPT.
Use (W)hole disk MBR, whole disk (G)PT or (E)dit? [whole]
Setting OpenBSD MBR partition to whole sd1...done.
The auto-allocated layout for sd1 is:

login:
```

OpenBSD kernel securelevel

- -1: Permanently insecure mode
 - init(8) will not attempt to raise the securelevel
 - may only be set with sysctl(8) while the system is insecure
- 0: Insecure mode
 - used during bootstrapping and while the system is single-user
 - all devices may be read or written subject to their permissions
 - system file flags may be cleared with chflags(2)
- 1: Secure mode
 - default mode when system is multi-user
 - securelevel may no longer be lowered except by init
 - /dev/mem and /dev/kmem cannot be opened
 - raw disk devices of mounted file systems are read-only
 - system immutable and append-only file flags may not be removed
 - Restrictions on a number of sysctl variables and GPIO settings
- 2: highly secure mode: all effects of level 1 plus
 - raw disk devices are always read-only whether mounted or not
 - `settimeofday(2)` and `clock_settime(2)` may not set the time backwards
 - `pf(4)` filter and NAT rules may not be altered

OpenBSD filesystem layout

- **/bsd** - The kernel
- **/bsd.mp** - The multiprocessing kernel, of you're on a platform that supports it
- **/bsd.rd** - The ramdisk kernel, used for installation
- **/bin/** - Statically-linked essential user tools
- **/sbin/** - Statically-linked essential superuser tools
- **/etc/** - Configuration files
- **/dev/** - Device files
- **/home/** - User home directories
- **/mnt/** - Empty mount point
- **/root/** - Root user home directory
- **/var/** - Persistent non-user data: logs, mail, databases, websites, etc.
- **/usr/bin/** - Most other user tools
- **/usr/sbin/** - Most other superuser tools
- **/usr/{lib,include,share}** - Program resources
- **/usr/local/{bin,lib,include}** - All package provided files, except for configuration files

OpenBSD user management

- **adduser** - Interactively add users
chpass - Interactively change user info
- **useradd** - Non-interactively add users
usermod - Non-interactively modify user info
- **userinfo** - Get information on a user
- **userdel** - Delete a user account

OpenBSD group management

- **groupadd** - Create a group
- **groupmod** - Modify a group
- **groupinfo** - Get information on a group
- **groupdel** - Delete a group

OpenBSD doas (sudo replacement)

```
[veraldi@puffy:$~$ doas /bin/ksh
[doas (veraldi@puffy.cnaf.infn.it) password:
[puffy# whoami
root
[puffy# exit
[veraldi@puffy:$~$ doas -L
```

OpenBSD syspatch

- utility to fetch, verify, install and revert OpenBSD binary patches
- Very fast and very simple to use
 - **-c** List available patches; suitable for cron(8).
 - **-I** List installed patches.
 - **-R** Revert all patches.
 - **-r** Revert the most recently installed patch.

OpenBSD rc

- command script that is invoked by init(8) when the system starts up
- Very simple
- **rcctl**: configure and control daemons and services
- Split up into several parts
 - **/etc/rc** - Startup command script
 - **/etc/rc.conf** - System daemon configuration database (don't touch)
 - **/etc/rc.conf.local** - System local configuration
 - **/etc/rc.d** - Location of rc.d(8) scripts

OpenBSD rc.conf.local

<daemon>_flags=<args>

- **apmd_flags=NO** - Daemon disabled
- **apmd_flags=** - Daemon enabled
- **apmd_flags=-A** - Daemons enabled with special flags
- Special services (**pf**, **ipsec**, etc.) only have a YES/NO option
pf_enable=YES
- **pkg_scripts** - Services that have to startup and shutdown in order
 - Example: **pkg_scripts=messagebus cupsd**

OpenBSD rcctl (usage example)

```
# rcctl set apmd status on
# rcctl set apmd flags -A
# rcctl get apmd
    apmd_class=daemon
    apmd_flags=-A
    apmd_rtable=0
    apmd_timeout=30
    apmd_user=root
```

OpenBSD logs

- Most logs goes into /var/log
 - Auth, PF, mail, daemons, etc.
- httpd logs into /var/www/logs
- Syslog configuration in /etc/syslog.conf

OpenBSD network interfaces

- ifconfig used for all network configuration
- No *ip/iw_config/wpa_supplicant/brcctl/vconfig/nmcli* etc.
 - Join wifi: *ifconfig iw0 join MySSID wpakey ThePassword*
 - Create VLAN: *ifconfig vlan10 create*
ifconfig vlan10 parent vio0 10.10.1.3/24
- /etc/hostname.<if> where <if> is the name of the interface
- /etc/netstart - Network startup script, configures: hostname, loopback ,bridges
- To re-apply a configuration to an interface: *sh /etc/netstart <if>*
- Possibility to create bridges, trunks, equal cost multi path routing

```
puffy$ cat /etc/hostname.vio0
inet 172.16.11.84 0xfffffe00
```

```
puffy$ cat /etc/myname
puffy.cnaf.infn.it
[puffy$ cat /etc/mygate
172.16.10.1
[puffy$ cat /etc/resolv.conf
lookup file bind
nameserver 131.154.3.1
```

```
[puffy# ifconfig bridge0 create
[puffy# ifconfig bridge0 add vio0
[puffy# ifconfig bridge0
bridge0: flags=0<>
        index 6 llprio 3
        groups: bridge
        priority 32768 hellotime 2 fwddelay 15 maxage 20 holdcnt 6 proto rstp
        designated: id 00:00:00:00:00:00 priority 0
        vio0 flags=3<LEARNING,DISCOVER>
                port 1 ifpriority 0 ifcost 0
        Addresses (max cache: 100, timeout: 240):
```

OpenBSD systat

- displays various system statistics in a screen-oriented fashion
 - Memory usage
 - Memory allocations
 - CPU usage
 - Network usage
 - Interface usage
 - I/O usage
 - Sensors
 - Firewall rules
 - Firewall connections
 - ...

OpenBSD package management

- `pkg_add`: for installing and upgrading packages
- `pkg_check`: for checking the consistency of installed packages
- `pkg_delete`: for removing installed packages
- `pkg_info`: for displaying information about packages

```
puffy$ doas pkg_add unzip
doas (veraldi@puffy.cnaf.infn.it) password:
quirks-3.326 signed on 2020-09-27T13:48:33Z
Ambiguous: choose package for unzip
a      0: <None>
      1: unzip-6.0p13
      2: unzip-6.0p13-iconv
Your choice: 1
unzip-6.0p13: ok
```

OpenBSD partitions

- Defined in /etc/fstab
- disklabel: utility can be used to install, examine, or modify the label on a disk
 - Partition **c** is the whole disk!!
 - *disklabel sd1*

#	size	offset	fstype	[fsiz	bsize	cpg]	
a:	104872256	64	4.2BSD	2048	16384	12960	# /
b:	16787925	104872320	swap				# none
c:	209711918	0	unused				
d:	41945696	121660256	4.2BSD	2048	16384	12960	# /var
e:	20980896	163605952	4.2BSD	2048	16384	12960	# /tmp
f:	25109568	184586848	4.2BSD	2048	16384	12960	# /home

- FFS2 (Enhanced Fast File System): derived from BSD UFS

OpenBSD commonly used commands

- **ksh(1)** default shell
- **sysctl(8)** manage kernel state
- **usbdevs(8)** to list usb devices
- **pcidump(8)** to list pci devices
- **disklabel(8)** to format OpenBSD disks
- **sysctl hw.disknames** to list disks
- **vmstat(8)** to check ram usage

OpenBSD PF

- OpenBSD packet filter for TCP/IP traffic and Network Address Translation, packet redirection, packet marking, authentication gateway
- capable of normalizing and conditioning TCP/IP traffic, as well as providing bandwidth control and packet prioritization
- Simple configuration and administration
- Ported to many other systems:
 - MacOS
 - iOS
 - FreeBSD (pfSense, OPNsense)
 - NetBSD
 - Solaris
 - QNX

OpenBSD PF controls

```
# pfctl -f /etc/pf.conf          Load the pf.conf file
# pfctl -nf /etc/pf.conf         Parse the file, but don't load it
# pfctl -sr                      Show the current ruleset
# pfctl -ss                      Show the current state table
# pfctl -si                      Show filter stats and counters
# pfctl -sa                      Show EVERYTHING it can show
```

OpenBSD PF default rules

```
root@puffy:$ /etc$ pfctl -sr
block return all
pass all flags S/SA
block return in on ! lo0 proto tcp from any to any port 6000:6010
block return out log proto tcp all user = 55
block return out log proto udp all user = 55
```

OpenBSD PF custom rules

```
[root@puffy:$ /home/veraldi$ pfctl -sr
match in all scrub (no-df)
block drop all
block drop in quick from urpf-failed to any
pass in quick on egress proto tcp from <goodssh> to any port = 22 flags S/SA
pass out on egress proto tcp all flags S/SA modulate state
pass out on egress proto udp all
pass out on egress proto icmp all
```

OpenBSD PF block specific user

```
root@puffy:$ /var/log$ pfctl -sr
match in all scrub (no-df)
block drop all
block drop in quick from urpf-failed to any
pass in quick on egress proto tcp from <goodssh> to any port = 22 flags S/SA
pass out on egress proto tcp all flags S/SA modulate state
pass out on egress proto udp all
pass out on egress proto icmp all
block drop out log on egress proto tcp from any to any port = 22 user = 1001
```

```
root@puffy:$ /var/log$ tcpdump -n -e -ttt -r /var/log/pflog outbound
tcpdump: WARNING: snaplen raised from 116 to 160
Sep 29 14:30:45.897580 rule 7/(match) block out on vio0: 172.16.11.84.47730 > 188.185.87.251.22: S

```

OpenBSD authpf gateway

- authpf: utility to implement an authentication gateway
- Access to the network is allowed only after successful authentication
- Scenarios:
 - Requiring users to authenticate before allowing internet access.
 - Granting certain users -- such as administrators -- access to restricted parts of the network.
 - Allowing only known users to access the rest of the network or internet from a wireless network segment.
 - Allowing workers from home or on the road access to resources on the company network.
 - Restrict segments of the local network only to certain users and give default access to guests

OpenBSD httpd

- OpenBSD has its own web server called httpd
- FastCGI and TLS support
- /etc/httpd.conf is required in order to activate httpd service

```
root@puffy:~$ cat /etc/httpd.conf
# $OpenBSD: httpd.conf,v 1.20 2018/06/13 15:08:24 reyk Exp $

server "puffy.cnaf.infn.it" {
    listen on * port 80
    root "/htdocs/"
}
```

OpenBSD OpenSMTPD

CSIRT example

```
pki crash.infn.it key "/etc/ssl/private/crash_infn_it.key"  
pki crash.infn.it cert "/etc/ssl/crash_infn_it.pem"  
ca crash.infn.it cert "/etc/ssl/cert.pem"
```

```
listen on egress port 25 tls pki crash.infn.it
```

```
action "local" mbox alias <aliases>  
action "relay" relay
```

```
match from any for domain "crash.infn.it" action "local"  
match for local action "local"  
match for any action "relay"
```

OpenBSD use cases @INFN

- Bastion hosts
- VPN servers
- CSIRT ticketing system and emails
- CSIRT systems with encrypted disks
- Firewalls
- CNAF DHCP

Questions ?

- Drop me an email if you end up installing OpenBSD

riccardo.veraldi@cnaf.infn.it
